

Pediatric Pathology

The Yale Pediatric Pathology Program provides diagnostic expertise covering a wide variety of diseases involving children of all ages, fetuses, and placentas. In collaboration with specialists in a number of disciplines, the service provides assistance to physicians and others seeking consultations for pediatric surgical specimens, pediatric gastrointestinal and liver biopsies, placentas, and autopsies, including fetuses with complex congenital malformations. Additionally, specific interest in small blue round cell tumors of childhood is a main focus of this service.
